1609 – User Profile Report

The **User Profile Report** shows the master file information for each user profile. User Profiles allow you to associate your users with specific claims based on claim criteria, payers, and facilities. For example, the system can automatically assign released claims to users based on Payer Status Rules (new) and User Profiles. User Profiles also drive the displayed content in the new Reconciliation Manager Dashboard. The functionality of User Profiles will continue to expand in later product updates so that when users access various features, they see only their associated claims.

- An empty field indicates the profile is all-inclusive for that item. For example, if there are no listed facilities, then the users in the profile are associated with claims for all of your site's facilities.
- A user can have more than one profile.
- The **Type of Bill** entry indicates any **Inpatient** or **Outpatient** selected settings. The **Bill Type** entry lists any specific bill types within the associated text field in the User Profile settings.
