Assurance Reimbursement Management™

Claim Event Notification file map (1860)

The Claim Event Notification file (1860) is a delimited file that contains information about selected events in a claim's history. It is best used when a client wants to export claim event data for external manipulation or to departments or applications that are external to this product. If desired, the data from the report can be returned to your health information system (HIS).

Events in the life of a claim are marked by adding codes and descriptions to the claims History tab. Any event that displays in the claim's History tab can be included in this file. The file requires a setup that is created in Reports > Report Setup > Claim Event Notification. This page allows users to select facilities and then select the events of interest for those facilities.

- The file uses the claim filter to select claims.
- The native file extension is .CSV. If your HIS requires another extension, change it before uploading.
- Each file contains all configurations set up in the Claim Event Notification setup page, one after the other.
- Configurations are facility based and determine which events apply to each facility.
- Inside each configuration, the report contains a row for every event named in the setup page.

Note: After a claim is included on a report, it will not be included on subsequent reports unless new events are added to the claim's history after the first report was created.

Col	Data field	Comment
A	Patient Control No.	Patient_ControlNo
B	Statement Thru Date	Claim_StmtThruDate
C	Entity	GenericFields_StateSpecField1
D	Plan Code	Not Used
E	Payer Name	Payer_PayerName
